                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to hepatic-fibrosis disease markers (ADF90539-ADF90071) and related proteins (ADF90872-ADF90917). The sequences are useful for detecting and treating hepatic fibrosis caused by alcohol consumption, virus infection, etc., and the associated chronic hepaticis, etc. leading to liver cirrhosis and hepatic carcinoma. The markers allow the cause of hepatic fibrosis to be clarified (diagnostic precision), so more suitable treatments can be developed and given.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatic fibrosis disease markers comprising polynucleotides or antibodies, useful for improved diagnosis, screening and developing to treat hepatitis, to control cirrhosis and carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 3935

Also described is a method for assessing neuroblastoma prognosis comprising: (a) labeling a gene transcriptional product obtained from the tumor cells of patients with neuroblastoma; (b) contacting the labeled CC material with the microarray, and (c) measuring label signals from the CC hybridized gene transcriptional product. The patient is judged to show good prognosis when significant label signals are obtained from those hybridized with 25 good prognosis probes, but however when significant clabel signals are obtained from those probes, such patient is judged to have poor prognosis. The method and microarrays are for assessing neuroblastoma prognosis, and therefore are useful in diagnosis, therapy selection and management of patients are contacting the patient as gene transcriptional product which shows accelerated expression in gatients having good prognosis of neuroblastoma accelerated expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-10-642-946-3 (1-1158) x ADZ26196 (1-3935)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Alignment Scores:

The present invention describes an isolated tumour-associated antigenic (RAT) nucleic acid comprising: (a) any of 4622 nucleotide sequences (see SEQ ID NO:1 to 4622); (b) the full-length coding region of (a); (c) the complement of (a) or (b); (d) a sequence that has 80% certified: (1) an expression vector comprising the above uncleic acid; (2) a host cell comprising the above expression vector comprising the above comprising: (a) an amino acid sequence encoded by the full-length coding region of the above expression vector; (3) (c) a process for producing a polypeptide; (4) an isolated polypeptide (c) length coding region of the above encoded by the full-cell comprising the above polypeptide; (b) an amino acid sequence encoded by the full-cell coding region of the above nucleotide sequences; or (c) a sequence comprising the above polypeptide; (f) a chimeric polypeptide; (f) an isolated antibody; (f) an anino acid sequence encoded by the full-cell comprising the above polypeptide; (f) a process for producing the antibody; (f) an anino acid sequence; or (c) a sequence comprising the above polypeptide; (f) a process for producing the antibody; (f) an anino acid sequence encoded by the full-cell comprising the above polypeptide; (f) a process for producing the antibody; (f) an anino acid sequence; or (c) a sequence comprising the above polypeptide; (f) a process for producing the antibody; (f) an antibody; (f) a nethod of comprising a container and the composition of matter comprising the above (chimeric) polypeptide; (f) a chimeric polypeptide; (f) a matibody; (f) an antibody and antibody; (f) a method of container; (f) method of cell that expresses the above protein, where the growth of the above protein; (f) a method of determining the protein cell state and the protein of antibody; (f) a method of antibody; (f) a method of attermining the protein of a medical and the present of a sequence represents a medical proliferative
                                                                                                                               Percent Similarity:
                                                                                                                                                                                              Alignment Scores:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
manmals. The invention also relates to nucleic acid and polypeptide
sequences at least 80% identical to the TAT nucleic acids and
polypeptides; expression vectors and host cells comprising a TAT nucleic
acid; an antibody specific for a TAT polypeptide; apeptide or organic
molecule which binds to a TAT polypeptide; fusion proteins comprising a
TAT polypeptide; and methods and compositions for the treatment or
diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
antibodies, antagonists, binding molecules and compositions are useful
for diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
increased TAT expression, particularly cancers such as breast cancer,
colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
cancer, pancreatic cancer, cervical cancer, liver cancer bedder
cancer, melanoma and leukaemia. TAT nucleic acids may further be
used as hybridisation probes, in chromosome and gene mapping, in
chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumour-associated antigenic target; TAT; human; overexpression; cutumour; diagnosis; cell proliferative disorder; breat cancer; colorectal cancer; lung cancer; ovarian cancer; liver cancer; central nervous system cancer; bladder cancer; pancreatic cancer; cervical cancer; melanoma; leukaemia; hybridisation probe; chromosome identification; chromosome mapping; gene mapping; gene therapy; cytostatic; gene; ss.
                                                                                                                                                                                                                                                                                                                                                     The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
The present invention describes a method for diagnosing and treating a cancer, e.g. breast, lung, colon, or kidney cancer. The method comprises detecting and blocking the over expression of a gene of a protein found in breast, lung, colon, or kidney tissue. Also described is an antibody or binding portion of an antibody that specifically binds a protein found in breast tissue, lung tissue, colon tissue, or kidney tissue. The methods, antibodies, polynucleotides and polypeptides from the present invention are useful for detecting, diagnosing, preventing and treating cancer, e.g. breast, lung, colon, or kidney cancer. The present sequence

888888¥& represents a nucleotide sequence given in the present invention, which is over expressed in human colon tumour tissue. N.B. All 385 sequences referenced in this patent are detailed in the US provisional application SN 60/447,900, filed 02/13/2003. In this application only one sequence, representing the longest sequence of each of the 65 clones is listed in Appendix A (and given as SEQ ID NO:1 to 65 in the Sequence Listing). Sequence 4125 967 A; 1321 Ç 1227 <u>Ω</u> 610 .<del>.</del> 0 ď 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
  This sequence represents a full-length nucleotide sequence that codes human E2A binding protein (E2A-BP, see AAW36816). It was isolated from human aortic RNA following 3 rounds of 5'RACE procedures. E2A-BP is expressed in vascular smooth muscle cells; mRNA is preferentially expressed in the aorta. E2A-BP interacts with E2A proteins in vivo, bit to both E12 and E47 and inhibits binding of E47 homodimer to an E-box
                                                                                                                                                                          DNA encoding human and mouse E2A binding proteins - useful for inhibiting or stimulating growth of vascular smooth muscle cells, e.g. for wound healing or treatment of rheumatoid arthritis or retinopathic diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo

```
probe (see AAT97606). Mouse (see AAT97611) and rat (see AAT97612-13) E2A-BP sequences have also been isolated. E2A-BP nucleic acids may be used in gene therapy and antisense methods for treating vascular diseases such as arteriosclerosis, to produce transgenic or knock-out animals, as well as in methods of producing E2A-BP polypeptides that can be used therapeutically to promote vascular smooth muscle cell growth e.g. for wound healing, or to screen for modulator compounds useful e.g. for the treatment of arteriosclerosis and angiogenesis. The E2A-BP gene promoter can be used in gene therapy methods to direct vascular smooth muscle cell specific expression of the E2A-BP gene, antisense sequences or
                                                                                                                                                                                                           heterologous genes

CC protein modification and maintenance molecules (PMMM). The cellular CC processes regulating modification and maintenance of protein modecules CC coordinate their function, conformation, stabilisation and degradation. CC Each of these processes is mediated by key enzymes or proteins such as CC kinases, phosphatases, proteases, protease inhibitors, isomerases, CC kransferases and molecular chaperones. Compounds which modulate the CC proteins of the invention may have anti-HIV, antiallergic, antiinflammatory, antiansemic, antiparkinsonian, nootropic, antityroid, cycostatic, hepatotropic, dermatological, antidiabetic, CC antityroid, cycostatic, hepatotropic, antiapreterio, immunosuppressive, cc antityroid, cycostatic, hepatotropic, antiapreterio, cycostatic, unopathic, chyopathic, antiparastic, antihelmintic, antiparathic, osteopathic, CC ophthalmological, antirheumatic, haemostatic, antibacterial, virucide, protezoacide or fungicide activities. The DNA sequence which encode the protezoacide or fungicide activities. The bunds of protein modification and maintenance molecules (PMMMs), the DNA sequences which encode them and their modulating compounds are useful for cidingnosing, treating or preventing disorders associated with aberrant cc primary thromobocytopaenia or cancer), developmental disorders (for example anteriosclerosis, hepatitis, polycythaemia vera, psoriasis, proteins of their modulating compounds are useful for cc example alzheimer's disease, Parkinson's disease or epilepsy').

CC autoimmune/inflammatory disorders (for example AlDS, allergies, asthma, autoimmune/inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel isolated human proteins, which are human concesses regulating modification and maintenance molecules (PMMM). The cellular processes regulating modification and maintenance of protein molecules coordinate their function, conformation, stabilisation and degradation. CE Each of these processes is mediated by key enzymes or proteins such as continuous proteins or proteins such as continuous proteins or proteins such as continuous proteins of the invention may have anti-HIV, antiallergic, antiinflammatory, antianaemic, antiparkinsonian, nootropic, antiinflammatory, antianaemic, antiparkinsonian, nootropic, contiinflammatory, antianaemic, antiparkinsonian, nootropic, antiinflammatory, antianaemic, antipartial immunosuppressive, contiinflammatory, antianaemic, antipartial immunosuppressive, contiinflammatory, antianaemic, antipartial, immunosuppressive, contiinflammatory, antianaemic, antipartial, virucide, cophthalmological, antirheumatic, haemostatic, antiparatic, virucide, cophthalmological, antirheumatic, haemostatic, antiparaticle, virucide, cophthalmological, antirheumatic, haemostatic, virucide, cophthalmological, antirheumatic, haemostatic, virucide, cophthalmological, antirheumatic, haemostatic, the DNA sequence which encode the protein modification and maintenance molecules (PMMMs), the DNA sequences which encode the protein of PMMM, particularly cell proliferative disorders (for cample anteriosclerosis, hepatitis, polycythaemia vera, psoriasis, cophthalmological, antirheumatic, haemostatitis, polycythaemia vera, psoriasis, cophthalmological, antirheumatic, haemostatic, antiparative disorders (for example Alzheimer's disease, Parkinson's disease or epilepsy, allergies, asthma, cophthalmological

ABQ54610
ID ABQ54610 standard; cDNA; 3523 BP.
XX
AC ABQ54610;
XX
DT 22-AUG-2002 (first entry)
XX
DE Human ovarian antigen HNTAK22 cDNA, Human ovarian antigen HNTAK22 cDNA, SEQ ID NO:490.

```
The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP41228) and to CDNAs encoding them (ABQ54131-ABQ56305), and also CC encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen CC polymucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, conformation of ovarian control ovarian cancer and breast-related disorders. Such conditions include ovarian cancer and breast-related CC disorders (e.g., infertility, disorders of pregnancy, anovulation, CC polycystic ovary syndrome, ovarian cystes, and dysmenorrhoea), endocrine CC disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic conditions (e.g., mastitls, oophoritis and commune disorders (e.g., congenital and acquired toxic conditions), immune disorders (e.g., congenital and acquired toxic conditions), immune disorders (e.g., congenital and acquired toxic conceptions), inflammatory conditions (e.g., mastitls, oophoritis and conceptions), inflammatory conditions (e.g., mastitls, oophoritis and conceptions), congenital and acquired toxic conditions (e.g., mastitls, ophoritis and conceptions), congenital and acquired conditions (e.g., respiratory disorders, neurological disorders, gastrointestinal disorders, candural control compounds which conditions (e.g., mastitls, systemic lupus erythematosus), conditions (e.g., mastitls, and toxic conditions), congenital and acquired polymucleotides may system disorders. Ovarian antigen polypeptides and conditions (e.g., mastrointestinal disorders, candural conditions), congenital and acquired polymucleotides may be used as food additives or to prepare antibodies constitutions (e.g., candural conditions), and the conditions (e.g., candural conditions), and the conditions (e.g., candural conditions), and the conditions (e.g., candural conditions), and the condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ovarian antigen; ovary; ovarian; breast; cancer; tumour; ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovullation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antibody preparation; cytostatic; immunomodulatory; neuroprotective;

It was isolated using CS FARCE with primers designed from mouse AEBP CDNA. E2A-BP is expressed in the vascular smooth muscle cells; mRNA is preferentially expressed in the CS aorta. E2A-BP interacts with E2A proteins in vivo, binds to both E12 and E47 and inhibits binding of E47 homodimer to an E-box probe (see CS AAT97668). Human (see AAT97699-10) and rat (see AAT97612-13) E2A-BP sequences have also been isolated. E2A-BP nucleic acids may be used in gene therapy and antisense methods for treating vascular diseases such as arteriosclerosis, to produce transpenic or knock-out animals, as well as in methods of producing E2A-BP polypeptides that can be used therapeutically to promote vascular smooth muscle cell growth e.g. for the creating or to screen for modulator compounds useful e.g. for the treatment of arteriosclerosis and anglogenesis. The E2A-BP gene promoter can be used in gene therapy methods to direct vascular smooth muscle cell especific expression of the E2A-BP gene, antisense sequences or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding human and mouse E2A binding proteins - useful for inhibiting or stimulating growth of vascular smooth muscle cells, e.g. for wound healing or treatment of rheumatoid arthritis or retinopathic diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS

                                                                                                        The cDNA of mouse OSF-5 was isolated from a mouse osteoblastic cell line MC3T3-E1 cDNA library constructed by a combination of PCR and the subtraction cloning method, followed by cloning using the differential screening technique. OSF-5 is a bone-specific carboxypeptidase which acts as an adhesion molecule or growth factor; it takes part in osteogenesis at the site of bone induction. OSF-5 can be used to treat bone metabolic diseases, e.g. osteoporosis, Paget's disease, osteomalacia, hyperostosis or osteopetrosis. (Updated on 25-MAR-2003 to correct PN field.) The invention relates to a gene expression profile comprising one or mor genes (AB234889-AB235692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, acrtic endothelium, dermal microvascular endothelium, pulmonary artery endothelium, myometrium microvascular endothelium, keratinocyte epithelium, bronchial epithelium, mammary epithelium, keratinocyte epithelium, renal cortical epithelium, renal proximal tubule epithelium, small cortical epithelium, umbilical artery smooth muscle, dermal fibroblast, pulmonary artery smooth muscle, dermal fibroblast, pulmonary artery smooth muscle, acrtic smooth muscle, mesangial cells, coronary artery smooth muscle, bronchial smooth muscle, uterine smooth muscle, lung fibroblast, bronchial smooth muscle, uterine smooth muscle, lung fibroblast,
                                                                                                                                                                                                                                                        New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying disease pathologies involving alterations of gene expression, e.g. cancer
                                                                                                                                                                                                                          Disclosure; Page 487-489; 850pp; English

The gene expression profile is used for determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving alterations of gene expression. The assessment of expression profiles may provide meaningful information with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for genetic and physical mapping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue identifications and in identifying promising antibiotics, antiviral or
